Linked list

Day 5: Algorithms and Data Structures Date : 29-March-2025 Two ways to implement the data in memory Topics: LinkedList 200 500 800 Arrays:static Linked list:Dynamic

Day 5: Algorithms and Data Structures

Date : 29-March-2025

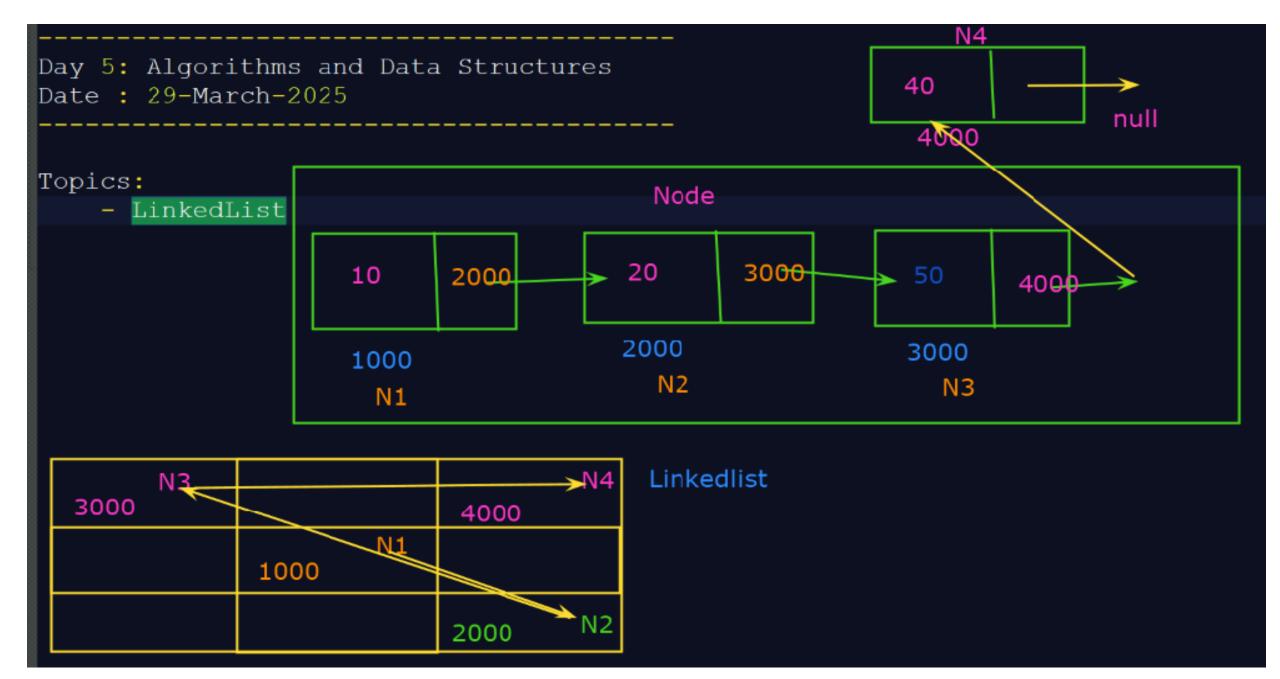

Topics:

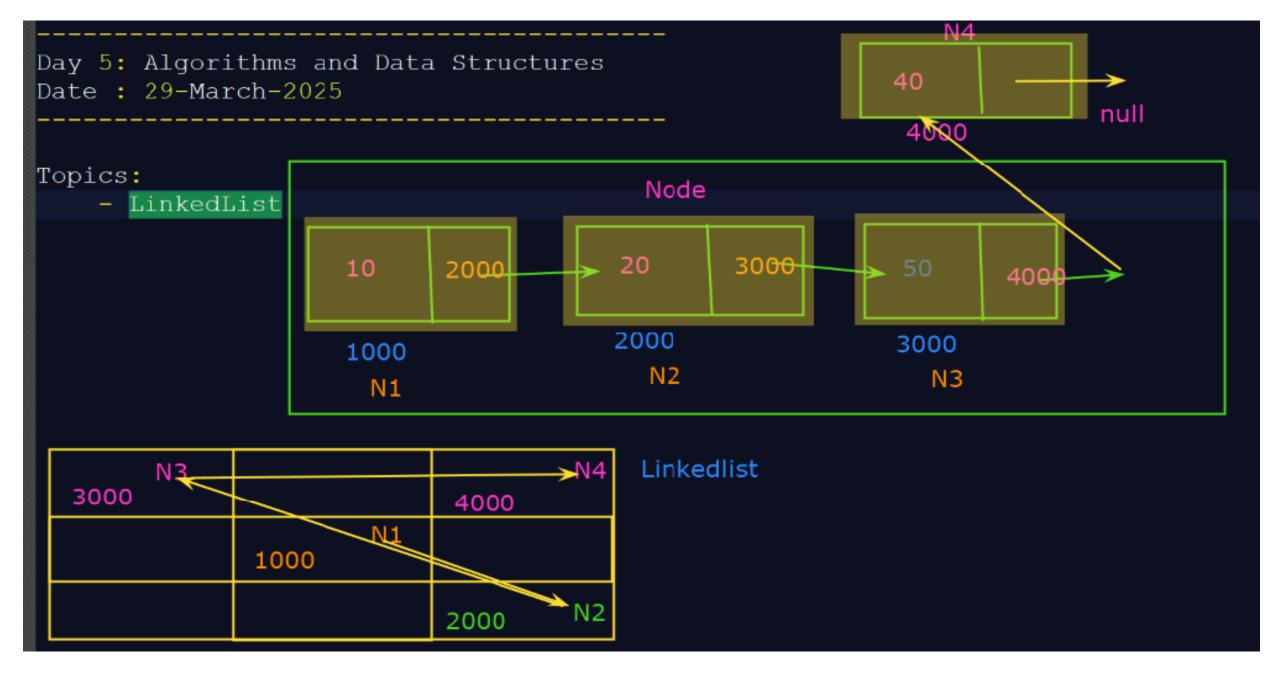

- LinkedList

data: contains the actual value

link: contains the address of the next node of the list

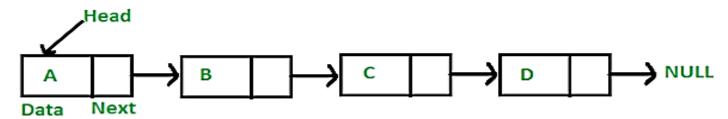

Linked List

- A linked list is a sequence of data structures, which are connected together via links.
- Linked List is a sequence of links which contains items.
- Each link contains a connection to another link.
- Linked list is the second most-used data structure after array.
- Following are the important terms to understand the concept of Linked List.
 - 1. Link Each link of a linked list can store a data called an element.
 - Next Each link of a linked list contains a link to the next link called Next.
 - LinkedList A Linked List contains the connection link to the first link called First.

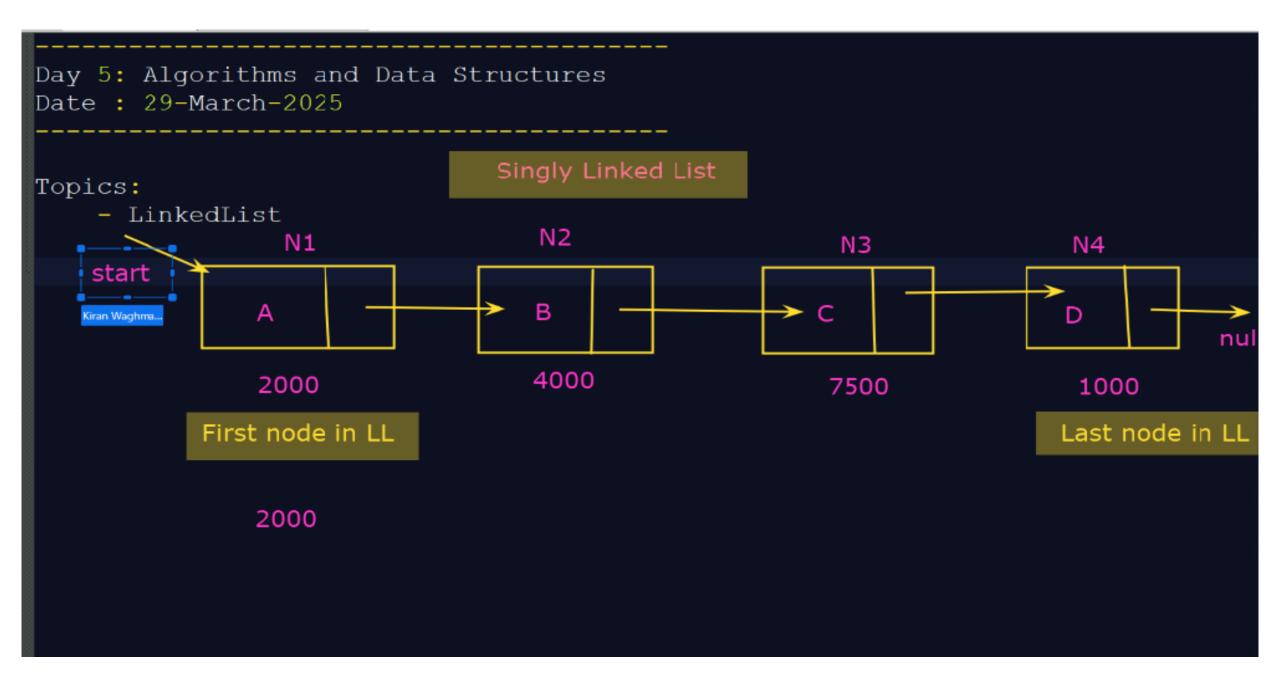

Day 5: Algorithms and Data Structures Date : 29-March-2025 Singly Linked List Topics: - LinkedList N2 N1 И3 N4 Α 4000 2000 7500 1000

Linked List Representation

 Linked list can be visualized as a chain of nodes, where every node points to the next node.

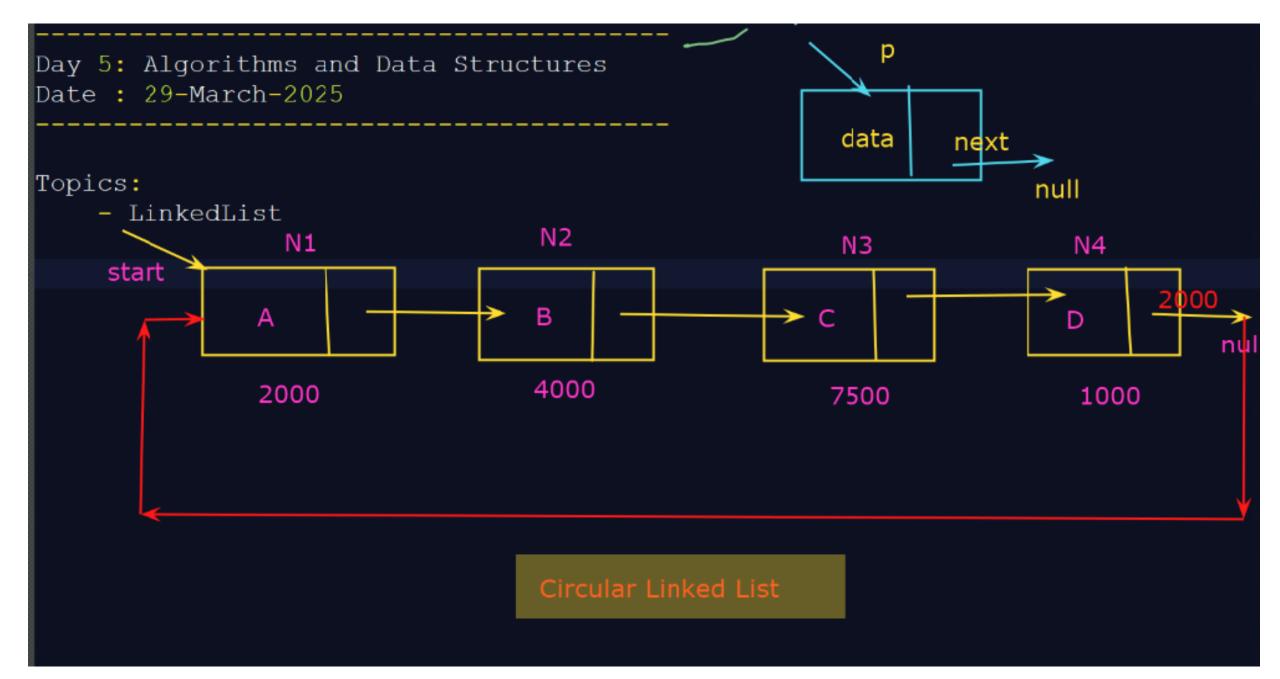

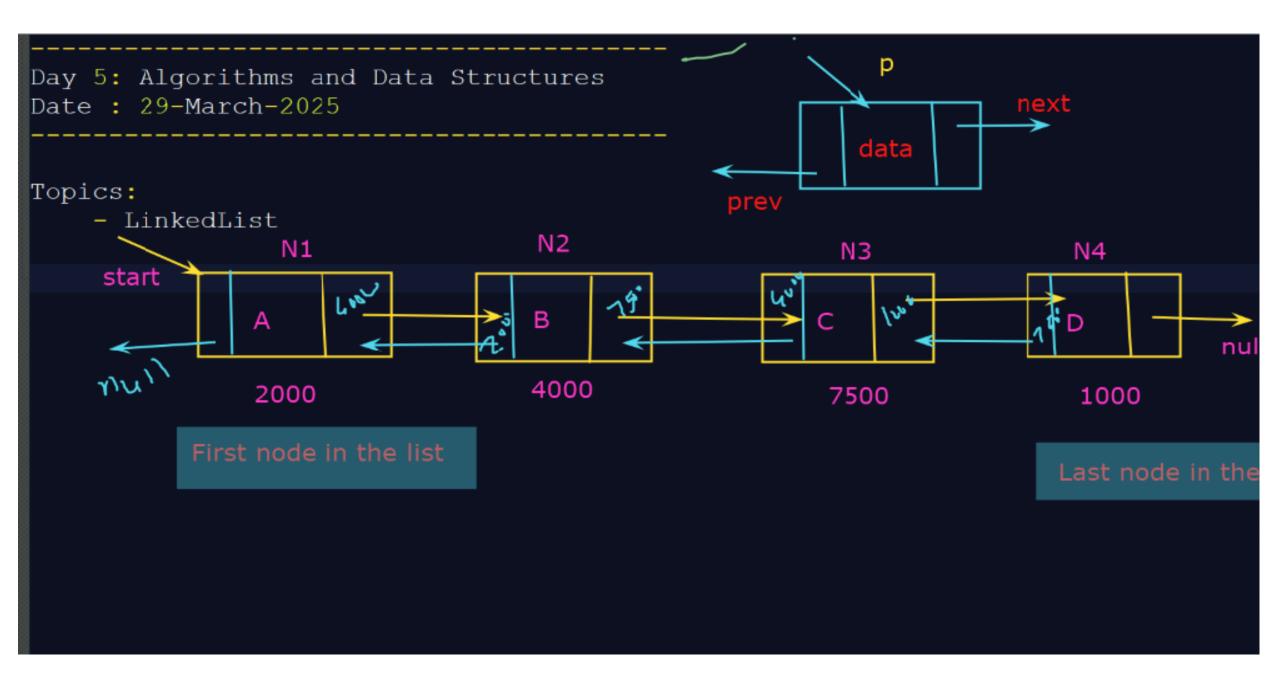

- As per the above illustration, following are the important points to be considered.
 - 1. Linked List contains a link element called first.
 - 2. Each link carries a data field(s) and a link field called next.
 - 3. Each link is **linked with its next link** using its **next link**.
 - 4. Last link carries a link as null to mark the end of the list.

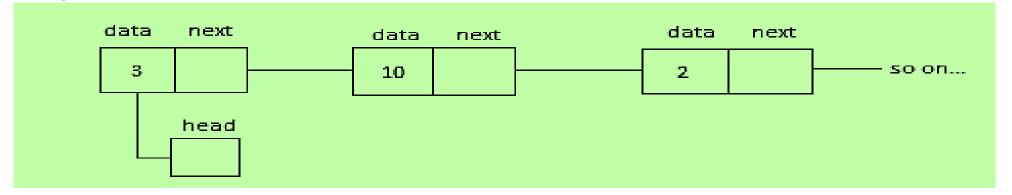

Types of Linked List

- Following are the various types of linked list.
 - Simple Linked List Item navigation is forward only.
 - 2. Doubly Linked List Items can be navigated forward and backward.
 - 3. Circular Linked List Last item contains link of the first element as next and the first element has a link to the last element as previous.

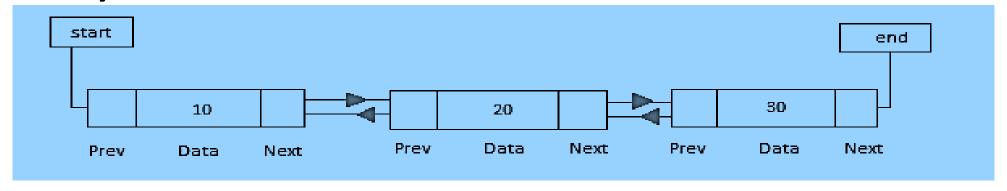

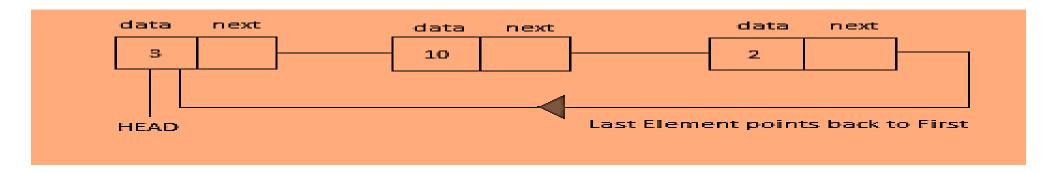

Simple Linked List

Doubly Linked List

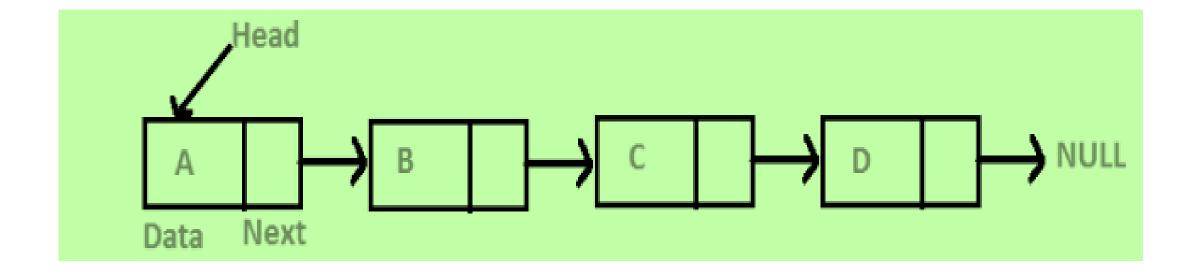

Circular Linked List

Singly Linked List

• Singly Linked Operations: Insert, Delete, Traverse, search, Sort, Merge

Advantages of Linked Lists

- They are a dynamic in nature which allocates the memory when required.
- 2. Insertion and deletion operations can be easily implemented.
- 3. Stacks and queues can be easily executed.
- 4. Linked List reduces the access time.

Disadvantages of Linked Lists

- 1. The memory is wasted as pointers require extra memory for storage.
- 2. No element can be accessed randomly; it has to access each node sequentially.
- 3. Reverse Traversing is difficult in linked list.

Applications of Linked Lists

- 1. Linked lists are used to implement stacks, queues, graphs, etc.
- Linked lists let you insert elements at the beginning and end of the list.
- 3. In Linked Lists we don't need to know the size in advance.

Basic Operations

- Following are the basic operations supported by a list.
 - 1. Insertion Adds an element at the beginning of the list.
 - 2. **Deletion** Deletes an element at the beginning of the list.
 - 3. Display Displays the complete list.
 - **4. Search** Searches an element using the given key.
 - 5. Delete Deletes an element using the given key.

```
int c = 0;
                                               prev
                            head
    while(temp != null) {
         C++;
         temp = temp.next;
                   temp
    return c;
                                                          →15
                                pos = 0
WA recursive F to count the number of nodes in LL:
int countR(){
                                                countR
    if(temp == null)
                                                1+countR()
         return 0;
    return | 1+countR(temp.next);
                                                1+(1+countR(
                                                1+(1+(1+countR(
                                                1+(1+(1+(1+countR())))
```
